Autoregressive Hidden Markov Models: Definition

▶ To overcome the poor modeling of long range correlations in HMMs, by allowing $Pa(X^t) \subseteq \{Z^t, X^{0:t}\}$.

$$Z^0 \longrightarrow Z^1 \longrightarrow Z^2 \longrightarrow Z^3 \longrightarrow Z^4$$

$$\downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow \qquad \downarrow \qquad \downarrow$$

$$X^0 \longrightarrow X^1 \longrightarrow X^2 \longrightarrow X^3 \longrightarrow X^4$$

▶ Hereinafter, we focus on the simplest AR-HMM, i.e. $Pa(X^t) = \{Z^t, X^{t-1}\}$.

Autoregressive Hidden Markov Models: Learning

- Almost the same as for HMMs.
- Recall that maximizing the log likelihood function over x^{0:T} is inefficient (no closed form solution) and ineffective (multimodal).
- Consider maximizing its expectation

$$E[\log p(Z^{0:T}, x^{0:T})] = \sum_{z^{0:T}} p(z^{0:T}|x^{0:T}) \log p(z^{0:T}, x^{0:T})$$

$$= \sum_{z^{0:T}} p(z^{0:T}|x^{0:T}) [\log \theta_{z^{0}} + \sum_{t=1}^{T-1} \log \theta_{z^{t+1}|z^{t}} + \sum_{t=1}^{T} \log \theta_{x^{t}|z^{t}, x^{t-1}}]$$

$$= \sum_{z^{0}} p(z^{0}|x^{0:T}) \log \theta_{z^{0}} + \sum_{t=1}^{T-1} \sum_{z^{t}} \sum_{z^{t+1}} p(z^{t}, z^{t+1}|x^{0:T}) \log \theta_{z^{t+1}|z^{t}} + \sum_{t=1}^{T} \sum_{z^{t}} p(z^{t}|x^{0:T}) \log \theta_{x^{t}|z^{t}, x^{t-1}}$$

Then

$$\begin{array}{l} \bullet \ \ \theta_{z}^{ML} = \frac{\rho(z^{0}|x^{0:T})}{\sum_{z_{0}}\rho(z^{0}|x^{0:T})} \\ \bullet \ \ \theta_{z^{t+1}|z^{t}}^{ML} = \frac{\sum_{t=1}^{T-1}\rho(z^{t},z^{t+1}|x^{0:T})}{\sum_{t=1}^{T-1}\sum_{z^{t+1}}\rho(z^{t},z^{t+1}|x^{0:T})} \\ \bullet \ \ \theta_{x^{t}|z^{t},x^{t-1}}^{ML} = \frac{\sum_{t=1}^{T}\rho(z^{t}|x^{0:T})\mathbf{1}_{\{x^{t},x^{t-1}\in x^{0:T}\}}}{\sum_{t=1}^{T}\rho(z^{t}|x^{0:T})\mathbf{1}_{\{x^{t},x^{t-1}\in x^{0:T}\}}} \end{array}$$

Note that computing $p(z^0|x^{0:T})$, $p(z^t, z^{t+1}|x^{0:T})$ and $p(z^t|x^{0:T})$ requires inference: Forward-backward algorithm.

Autoregressive Hidden Markov Models: Forward-Backward Algorithm

$$\begin{split} \rho(z^{t}|x^{0:T}) &= \frac{\rho(x^{0:t-1}, x^{t+1:T}|z^{t}, x^{t})\rho(z^{t}, x^{t})}{\rho(x^{0:T})} \\ &= \frac{\rho(x^{0:t-1}|z^{t}, x^{t})\rho(z^{t}, x^{t})\rho(x^{t+1:T}|z^{t}, x^{t})}{\rho(x^{0:T})} \text{ by } X^{0:t-1} \bot_{\rho} X^{t+1:T}|Z^{t} \cup X^{t} \\ &= \frac{\rho(x^{0:t}, z^{t})\rho(x^{t+1:T}|z^{t}, x^{t})}{\rho(x^{0:T})} = \frac{\alpha(z^{t})\beta(z^{t})}{\sum_{z^{t}} \alpha(z^{t})\beta(z^{t})} \\ \rho(z^{t}, z^{t+1}|x^{0:T}) &= \frac{\rho(x^{0:t-1}, x^{t+2:T}|z^{t}, z^{t+1}, x^{t}, x^{t+1})\rho(z^{t}, z^{t+1}, x^{t}, x^{t+1})}{\rho(x^{0:T})} \\ &= \frac{\rho(x^{0:t-1}|z^{t}, x^{t})\rho(x^{t+2:T}|z^{t+1}, x^{t+1})\rho(x^{t+1}|z^{t+1}, x^{t})\rho(z^{t+1}|z^{t})\rho(z^{t}, x^{t})}{\rho(x^{0:T})} \\ \text{by } X^{0:t-1} \bot_{\rho} X^{t+2:T}|Z^{t} \cup Z^{t+1} \cup X^{t} \cup X^{t+1} \\ &= \frac{X^{0:t-1}}{X^{t+2:T}} \bot_{\rho} Z^{t} \cup X^{t}|Z^{t+1} \cup X^{t}}{Z^{t+1}} \\ &= \frac{\alpha(z^{t})\beta(z^{t+1})\rho(x^{t+1}|z^{t+1}, x^{t})\rho(z^{t+1}|z^{t})}{\sum_{t} \sum_{t+1} \alpha(z^{t})\beta(z^{t+1})\rho(x^{t+1}|z^{t+1}, x^{t})\rho(z^{t+1}|z^{t})} \end{split}$$

Autoregressive Hidden Markov Models: Forward-Backward Algorithm

$$\alpha(\mathbf{z}^{t}) = p(x^{t}|z^{t}, x^{t-1})p(z^{t}, x^{t-1})p(x^{0:t-2}|z^{t}, x^{t-1}) \text{ by } X^{0:t-2} \perp_{p} X^{t}|Z^{t} \cup X^{t-1}$$

$$= p(x^{t}|z^{t}, x^{t-1})p(x^{0:t-1}, z^{t}) = p(x^{t}|z^{t}, x^{t-1}) \sum_{z^{t-1}} p(x^{0:t-1}, z^{t}|z^{t-1})p(z^{t-1})$$

$$= p(x^{t}|z^{t}, x^{t-1}) \sum_{z^{t-1}} p(x^{0:t-1}|z^{t-1})p(z^{t}|z^{t-1})p(z^{t-1}) \text{ by } X^{0:t-1} \perp_{p} Z^{t}|Z^{t-1}$$

$$= p(x^{t}|z^{t}, x^{t-1}) \sum_{z^{t-1}} p(x^{0:t-1}, z^{t-1})p(z^{t}|z^{t-1})$$

$$= p(x^{t}|z^{t}, x^{t-1}) \sum_{z^{t-1}} \alpha(z^{t-1})p(z^{t}|z^{t-1}) \text{ with } \alpha(z^{0}) = p(x^{0}|z^{0})p(z^{0})$$

$$\beta(z^{t}) = \sum_{z^{t+1}} p(x^{t+1:T}, z^{t+1}|z^{t}, x^{t}) = \sum_{z^{t+1}} p(x^{t+1:T}|z^{t+1}, z^{t}, x^{t})p(z^{t+1}|z^{t}, x^{t})$$

$$= \sum_{z^{t+1}} p(x^{t+1:T}|z^{t+1}, x^{t})p(z^{t+1}|z^{t}) \text{ by } X^{t+1:T} \perp_{p} Z^{t}|Z^{t+1} \cup X^{t} \text{ and } X^{t} \perp_{p} Z^{t+1}|Z^{t}$$

$$= \sum_{z^{t+1}} p(x^{t+2:T}|z^{t+1}, x^{t+1})p(x^{t+1}|z^{t+1}, x^{t})p(z^{t+1}|z^{t}) \text{ by } X^{t+2:T} \perp_{p} X^{t}|Z^{t+1} \cup X^{t+1}$$

$$= \sum_{z^{t+1}} \beta(z^{t+1})p(x^{t+1}|z^{t+1}, x^{t})p(z^{t+1}|z^{t})$$

$$\beta(z^{T}) = 1 \text{ by } p(z^{T}|x^{0:T}) = \frac{\alpha(z^{T})\beta(z^{T})}{p(x^{0:T})} = p(z^{T}|x^{0:T})\beta(z^{T})$$

Exercise. Derive the Viterbi algorithm for AR-HMMs.

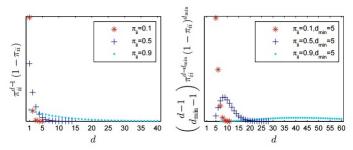

Explicit-Duration Hidden Markov Models: Definition

- To control the distribution of the number of time steps for which the HMM remains in a given state.
- Consider the following Markov chain over the states:

▶ The probability of remaining in state z_i for exactly d-1 time steps is

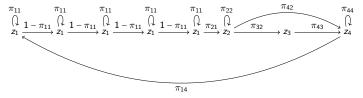

$$p(Z^{t+1:t+d-1} = z_i, Z^{t+d} \neq z_i | Z^t = z_i) = \pi_{ii}^{d-1} (1 - \pi_{ii}) = Geometric(d; 1 - \pi_{ii})$$

Source: Chiappa (2014).

Explicit-Duration Hidden Markov Models: Definition

We can obtain a negative binomial distribution by imposing a minimum duration on the time spent in a state, and duplicating the corresponding observation model. For instance, when d_{min} = 5

▶ The probability of remaining in state z_i for exactly d-1 time steps is

$$p(Z^{t+1:t+d-1} = z_i, Z^{t+d} \neq z_i | Z^t = z_i) = \begin{pmatrix} d-1 \\ d_{min}-1 \end{pmatrix} \pi_{ii}^{d-d_{min}} (1 - \pi_{ii})^{d_{min}}$$

$$= NegativeBinomial(d; d_{min}, 1 - \pi_{ii})$$

9/1

Explicit-Duration Hidden Markov Models: Decreasing

- The geometric and negative binomial cases define a segment duration distribution implicitly. We now define the segment duration distribution explicitly, by introducing auxiliary unobserved random variables.
- ▶ Specifically, let us use the random variables $C^{1:T}$ which take **decreasing** values within a segment, starting with the duration of the segment and ending with 1. Then

$$p(z_i^t|z_j^{t-1}, c^{t-1}) = \begin{cases} \pi_{ij} & \text{if } c^{t-1} = 1\\ 1_{i=j} & \text{if } c^{t-1} > 1 \end{cases}$$

$$p(c^t|z^t, c^{t-1}) = \begin{cases} \rho(z^t, c^t) & \text{if } c^{t-1} = 1\\ 1_{c^t = c^{t-1} - 1} & \text{if } c^{t-1} > 1 \end{cases}$$

where $\rho(z^t, c^t)$ is the segment duration distribution.

▶ In graphical terms, we have

10/1

Explicit-Duration Hidden Markov Models: Increasing

▶ Alternatively, we can use the random variables $C^{1:T}$ which take **increasing** values within a segment, starting 1 and ending with the duration of the segment. Then

$$p(z_i^t|z_j^{t-1}, c^t) = \begin{cases} \pi_{ij} & \text{if } c^t = 1\\ 1_{i=j} & \text{if } c^t > 1 \end{cases}$$

$$p(c^t|z^{t-1}, c^{t-1}) = \begin{cases} 1 - \lambda(z^{t-1}, c^{t-1}) & \text{if } c^t = 1\\ \lambda(z^{t-1}, c^{t-1}) & \text{if } c^t = c^{t-1} + 1 \end{cases}$$

where $\lambda(z^{t-1}, c^{t-1})$ is the probability of the segment continuing.

In graphical terms, we have

Explicit-Duration Hidden Markov Models: Decreasing-Duration

Alternatively, we can use the random variables $C^{1:T}$ which take **decreasing** values within a segment, starting with the duration of the segment and ending with 1. And the random variables $D^{1:T}$ which indicate the **duration** of the current segment. Then

$$\begin{split} \rho(z_i^t|z_j^{t-1},c^{t-1}) &= \begin{cases} \pi_{ij} & \text{if } c^{t-1} = 1\\ 1_{i=j} & \text{if } c^{t-1} > 1 \end{cases} \\ \rho(c^t|c^{t-1},d^t) &= \begin{cases} 1_{c^t=d^t} & \text{if } c^{t-1} = 1\\ 1_{c^t=c^{t-1}-1} & \text{if } c^{t-1} > 1 \end{cases} \\ \rho(d^t|z^t,c^{t-1},d^{t-1}) &= \begin{cases} \rho(z^t,d^t) & \text{if } c^{t-1} = 1\\ 1_{d^t=d^{t-1}} & \text{if } c^{t-1} > 1 \end{cases} \end{split}$$

where $\rho(z^t, d^t)$ is the segment duration distribution.

In graphical terms, we have

$$C^{t-1} \rightarrow C^t \rightarrow C^{t+1}$$

$$\uparrow \qquad \uparrow \qquad \uparrow \qquad \uparrow$$

$$D^{t-1} \rightarrow D^t \rightarrow D^{t+1}$$

$$\uparrow \qquad \downarrow \qquad \downarrow$$

$$Z^{t-1} \rightarrow Z^t \rightarrow Z^{t+1}$$

$$\downarrow \qquad \downarrow$$

$$X^{t-1} \qquad X^t \qquad X^{t+1}$$

Explicit-Duration Hidden Markov Models: Increasing-Duration

- **Exercise**. Derive the transition model for the increasing-duration case.
- Relatively easy to adapt the FB and Viterbi algorithms to explicit-duration HMMs.
