Dynamic Bayesian Networks: Definition

- ► To model **sequential data**, e.g. time series data.
- **Simplification**: Time is discretized in equal width intervals, i.e. t = 0, 1, ...
- Consider a finite set of discrete random variables $X^t = \{X_1^t, \dots, X_n^t\}$ representing the state at time t of a system described by $X = \{X_1, \dots, X_n\}$.
- A dynamic Bayesian network (DBN) is a BN over $X^{0:T} = \{X^0, \dots, X^T\}$. Thus, it defines $p(x^{0:T})$.

▶ **Assumption**: The system is Markovian, i.e. $X^{t+1} \perp_p X^{0:t-1} | X^t$.

Assumption: The system is stationary, i.e. $p(x^{t+1}|x^t) = p(x'|x)$.

$$\begin{array}{c} X_1^0 \longrightarrow X_1^1 \longrightarrow X_1^2 \longrightarrow X_3^3 \longrightarrow X_4^4 \\ \downarrow \qquad \uparrow \qquad \uparrow \qquad \uparrow \qquad \uparrow \qquad \uparrow \\ X_2^0 \qquad X_2^1 \qquad X_2^2 \qquad X_2^3 \qquad X_2^4 \\ \downarrow \qquad \uparrow \qquad \uparrow \qquad \uparrow \qquad \uparrow \qquad \uparrow \\ X_3^0 \longrightarrow X_3^1 \longrightarrow X_3^2 \longrightarrow X_3^3 \longrightarrow X_3^4 \end{array}$$

Dynamic Bayesian Networks

- ▶ Then, a DBN over $X^{0:T}$ can be defined as
 - ightharpoonup a BN over X^0 , and
 - ▶ a BN over $X^t \cup X^{t+1}$ where the nodes in X^t are parentless.

Initial model	Transition model
X_1^0	$X_1^t \rightarrow X_1^{t+1}$
Ţ	1
X_{2}^{0}	X_2^t X_2^{t+1}
Ţ	1
X_3^0	$X_3^t \rightarrow X_3^{t+1}$

▶ DBN unrolled for *T* = 4.

$$\begin{array}{c} X_1^0 \longrightarrow X_1^1 \longrightarrow X_1^2 \longrightarrow X_3^3 \longrightarrow X_4^4 \\ \downarrow \qquad \uparrow \qquad \uparrow \qquad \uparrow \qquad \uparrow \\ X_2^0 \qquad X_2^1 \qquad X_2^2 \qquad X_2^3 \qquad X_2^4 \\ \downarrow \qquad \uparrow \qquad \uparrow \qquad \uparrow \qquad \uparrow \\ X_3^0 \longrightarrow X_3^1 \longrightarrow X_3^2 \longrightarrow X_3^3 \longrightarrow X_3^4 \end{array}$$

► The DBN defines

$$p(x^{0:T}) = p(x^{0}) \prod_{t=0}^{T-1} p(x^{t+1}|x^{t}) = \left[\prod_{i=1}^{n} p(x_{i}^{0}|pa_{i}^{0})\right] \left[\prod_{t=0}^{T-1} \prod_{i=1}^{n} p(x_{i}^{t+1}|pa_{i}^{t+1})\right]$$

Hidden Markov Models: Definition

- ▶ To overcome the **Markovian limitation** of DBNs, while keeping sparsity.
- A hidden Markov model (HMM) over $\{Z^{0:T}, X^{0:T}\}$ where $X^{0:T}$ are observed and $Z^{0:T}$ are unobserved consists of
 - ightharpoonup a DBN over $Z^{0:T}$. and
 - ▶ a BN over $Z^t \cup X^t$ where the nodes in Z^t are parentless.

		•
Initial model	Transition model	Emission model
$Z_1^0 \downarrow Z_2^0 \downarrow Z_3^0$	$Z_1^t \to Z_1^{t+1}$ \uparrow $Z_2^t Z_2^{t+1}$ \uparrow $Z_3^t \to Z_3^{t+1}$	Z_1^t Z_2^t Z_3^t X_1^t

▶ HMM unrolled for T = 4.

▶ A HMM is a DBN that defines

$$p(z^{0:T}, x^{0:T}) = p(z^0) \prod_{t=1}^{T-1} p(z^{t+1}|z^t) \prod_{t=0}^{T} p(x^t|z^t)$$

Hidden Markov Models: Learning

▶ The structure is typically fixed to

$$Z^{0} \longrightarrow Z^{1} \longrightarrow Z^{2} \longrightarrow Z^{3} \longrightarrow Z^{4}$$

$$\downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow$$

$$X^{0} \qquad X^{1} \qquad X^{2} \qquad X^{3} \qquad X^{4}$$

- Consider a sample with a **single** observation over $X^{0:T}$.
- Parameter learning: EM algorithm.
- ightharpoonup Cardinality of Z^t ? BIC score to select among a set of plausible values.

7/13

Hidden Markov Models: Learning

- Recall that maximizing the log likelihood function over $x^{0:T}$ is inefficient (no closed form solution) and ineffective (multimodal).
- Consider maximizing its expectation

$$E[\log p(Z^{0:T}, x^{0:T})] = \sum_{z^{0:T}} p(z^{0:T} | x^{0:T}) \log p(z^{0:T}, x^{0:T})$$

$$= \sum_{z^{0:T}} p(z^{0:T} | x^{0:T}) [\log \theta_{z^0} + \sum_{t=1}^{T-1} \log \theta_{z^{t+1} | z^t} + \sum_{t=1}^{T} \log \theta_{x^t | z^t}]$$

$$= \sum_{z^0} p(z^0|x^{0:T}) \log \theta_{z^0} + \sum_{t=1}^{T-1} \sum_{z^t} \sum_{z^{t+1}} p(z^t, z^{t+1}|x^{0:T}) \log \theta_{z^{t+1}|z^t} + \sum_{t=1}^{T} \sum_{z_t} p(z^t|x^{0:T}) \log \theta_{x^t|z^t}$$

Then

$$\begin{array}{ll} \bullet & \theta_{z}^{ML} = \frac{\rho(z^{0}|x^{0:T})}{\sum_{z^{0}} \rho(z^{0}|x^{0:T})} \\ \bullet & \theta_{z}^{ML} = \frac{\sum_{t=1}^{t-1} \rho(z^{t},z^{t+1}|x^{0:T})}{\sum_{t=1}^{t-1} \sum_{z^{t+1}} \rho(z^{t},z^{t+1}|x^{0:T})} \\ \bullet & \theta_{x^{t}|z^{t}}^{ML} = \frac{\sum_{t=1}^{T} \rho(z^{t}|x^{0:T})1_{\{x^{t} \in x^{0:T}\}}}{\sum_{t=1}^{T} \rho(z^{t}|x^{0:T})} \end{array}$$

Note that computing $p(z^0|x^{0:T})$, $p(z^t, z^{t+1}|x^{0:T})$ and $p(z^t|x^{0:T})$ requires inference: Forward-backward algorithm.

Hidden Markov Models: Forward-Backward Algorithm

$$\begin{split} \rho(z^{t}|x^{0:T}) &= \frac{\rho(x^{0:T}|z^{t})\rho(z^{t})}{\rho(x^{0:T})} \\ &= \frac{\rho(x^{0:t}|z^{t})\rho(z^{t})\rho(x^{t+1:T}|z^{t})}{\rho(x^{0:T})} \text{ by } X^{0:t} \perp_{\rho} X^{t+1:T}|Z^{t} \\ &= \frac{\rho(x^{0:t},z^{t})\rho(x^{t+1:T}|z^{t})}{\rho(x^{0:T})} = \frac{\alpha(z^{t})\beta(z^{t})}{\sum_{z^{t}}\alpha(z^{t})\beta(z^{t})} \\ \rho(z^{t},z^{t+1}|x^{0:T}) &= \frac{\rho(x^{0:T}|z^{t},z^{t+1})\rho(z^{t},z^{t+1})}{\rho(x^{0:T})} \\ &= \frac{\rho(x^{0:t}|z^{t})\rho(x^{t+1}|z^{t+1})\rho(x^{t+2:T}|z^{t+1})\rho(z^{t+1}|z^{t})\rho(z^{t})}{\rho(x^{0:T})} \\ \text{by } X^{0:t} \perp_{\rho} X^{t+1:T}|Z^{t} \cup Z^{t+1} \\ &= \frac{\lambda^{0:t}}{\lambda^{t+1:T}} \sum_{z^{t}} \sum_{z^{t+1}} \alpha(z^{t})\rho(x^{t+1}|z^{t+1})\rho(z^{t+1}|z^{t})}{\lambda^{t+1}} \\ &= \frac{\alpha(z^{t})\beta(z^{t+1})\rho(x^{t+1}|z^{t+1})\rho(z^{t+1}|z^{t})}{\sum_{z^{t}} \sum_{z^{t+1}} \alpha(z^{t})\beta(z^{t+1})\rho(x^{t+1}|z^{t+1})\rho(z^{t+1}|z^{t})} \end{split}$$

Hidden Markov Models: Forward-Backward Algorithm

$$\alpha(\mathbf{z^{t}}) = p(x^{0:t}, z^{t}) = p(x^{0:t}|z^{t})p(z^{t}) = p(x^{t}|z^{t})p(z^{t})p(x^{0:t-1}|z^{t}) \text{ by } X^{0:t-1} \perp_{p} X^{t}|Z^{t}$$

$$= p(x^{t}|z^{t})p(x^{0:t-1}, z^{t}) = p(x^{t}|z^{t}) \sum_{z^{t-1}} p(x^{0:t-1}, z^{t}|z^{t-1})p(z^{t-1})$$

$$= p(x^{t}|z^{t}) \sum_{z^{t-1}} p(x^{0:t-1}|z^{t-1})p(z^{t}|z^{t-1})p(z^{t-1}) \text{ by } X^{0:t-1} \perp_{p} Z^{t}|Z^{t-1}$$

$$= p(x^{t}|z^{t}) \sum_{z^{t-1}} p(x^{0:t-1}, z^{t-1})p(z^{t}|z^{t-1}) = p(x^{t}|z^{t}) \sum_{z^{t-1}} \alpha(z^{t-1})p(z^{t}|z^{t-1})$$

$$= p(x^{t}|z^{t}) \sum_{z^{t-1}} p(x^{0:t-1}, z^{t-1})p(z^{t}|z^{t-1}) = p(x^{t}|z^{t}) \sum_{z^{t-1}} \alpha(z^{t-1})p(z^{t}|z^{t-1})$$

$$= p(x^{0}, z^{0}) = p(x^{0}|z^{0})p(z^{0})$$

$$= p(x^{0}, z^{0}) = p(x^{0}|z^{0})p(z^{0})$$

$$= p(x^{t+1:T}|z^{t}) = \sum_{z^{t+1}} p(x^{t+1:T}, z^{t+1}|z^{t}) = \sum_{z^{t+1}} p(x^{t+1:T}|z^{t+1}, z^{t})p(z^{t+1}|z^{t})$$

$$= \sum_{z^{t+1}} p(x^{t+1:T}|z^{t+1})p(z^{t+1}|z^{t}) \text{ by } X^{t+1:T} \perp_{p} Z^{t}|Z^{t+1}$$

$$= \sum_{z^{t+1}} p(x^{t+2:T}|z^{t+1})p(x^{t+1}|z^{t+1})p(z^{t+1}|z^{t}) \text{ by } X^{t+2:T} \perp_{p} X^{t+1}|Z^{t+1}$$

$$= \sum_{z^{t+1}} \beta(z^{t+1})p(x^{t+1}|z^{t+1})p(z^{t+1}|z^{t})$$

$$= p(x^{t+1:T}|z^{t+1})p(x^{t+1}|z^{t+1})p(z^{t+1}|z^{t})$$

$$= p(x^{t+1:T}|z^{t+1})p(x^{t+1}|z^{t+1})p(x^{t+1}|z^{t})$$

Hidden Markov Models: Forward-Backward Algorithm

FB algorithm

$$\begin{split} &\alpha(z^0) \coloneqq p(x^0|z^0)p(z^0) \\ &\text{For } t = 1, \dots, T \text{ do} \\ &\alpha(z^t) \coloneqq p(x^t|z^t) \sum_{z^{t-1}} \alpha(z^{t-1})p(z^t|z^{t-1}) \\ &\beta(z^T) \coloneqq 1 \\ &\text{For } t = T - 1, \dots, 0 \text{ do} \\ &\beta(z^t) \coloneqq \sum_{z^{t+1}} \beta(z^{t+1})p(x^{t+1}|z^{t+1})p(z^{t+1}|z^t) \\ &\text{Return } \alpha(z^0), \dots, \alpha(z^T), \beta(z^0), \dots, \beta(z^T) \end{split}$$

- Unlike the LS algorithm, the FB algorithm consists of two independent steps.
- Filtering: $p(z^t|x^{0:t}) = \frac{\alpha(z^t)}{\sum_{z^t} \alpha(z^t)}$.
- Smoothing: $p(z^t|x^{0:T}) = \frac{\alpha(z^t)\beta(z^t)}{\sum_{z^t} \alpha(z^t)\beta(z^t)}$.

Hidden Markov Models: Viterbi Algorithm

To compute the most probable configuration for HMMs.

Viterbi algorithm

```
\begin{split} & \omega(z^0) \coloneqq \log p(z^0) + \log p(x^0|z^0) \\ & \text{For } t = 0, \dots, T - 1 \text{ do} \\ & \omega(z^{t+1}) \coloneqq \log p(x^{t+1}|z^{t+1}) + \max_{z^t} [\log p(z^{t+1}|z^t) + \omega(z^t)] \\ & \psi(z^{t+1}) \coloneqq \arg \max_{z^t} [\log p(z^{t+1}|z^t) + \omega(z^t)] \\ & z_{\max}^T = \arg \max_{z^T} \omega(z^T) \\ & \text{For } t = T - 1, \dots, 0 \text{ do} \\ & z_{\max}^t \coloneqq \psi(z_{\max}^{t+1}) \\ & \text{Return } z_{\max}^{0.T} \end{split}
```

Exercise. Prove that the Viterbi algorithm is correct.
